

Full-Stack Integration Exercise (Next.js + Rust Backend + TLS)

Task:

Build a **simple UI in Next.js** that interacts with the Rust API from PSE Assessment 1.

Requirements:

1. Create a page `/inventory` that:
 - Lists certificates (GET request)
 - Shows details when clicking an item
 - Uses **Next.js server-side rendering (SSR)**
2. Include a small **dashboard component** showing:
 - Total certificates
 - Certificates expiring soon (next 30 days)
3. Secure the API requests using:
 - TLS (self-signed cert is fine)
 - Or demonstrate mTLS via local configs (explain setup)
4. Bonus:
 - Use SWR or React Query for fetching
 - Implement pagination or filtering
 - Add reusable UI components
 - Use TypeScript with strict mode
