

Build a **Next.js application** (TypeScript required) with the following:

Functional Requirements

1. Inventory Dashboard

- Display a list of items (simulate 50k+ records)
- Columns: ID, Name, Type, Status, Last Updated
- Filtering + sorting
- Pagination or virtualized rendering

2. Detail View

- Click an item → view details page
- Use SSR or Server Components

3. Accessibility

- Keyboard navigable
- Proper semantic HTML
- Accessible table markup
- Screen-reader friendly labels

4. Performance

- Avoid unnecessary re-renders
- Optimize rendering for large datasets
- Explain performance decisions in README

Technical Constraints

- Next.js (latest stable)
 - TypeScript
 - Functional components only
 - No UI frameworks required (optional)
-

Bonus:

- Use virtualization (e.g., react-window)
 - Implement loading/skeleton states
 - Use React.memo, useCallback, useMemo appropriately
 - Accessibility testing notes (axe, Lighthouse)
 - Clean folder structure and reusable components
-

What the Candidate Must Deliver

- Write working version of the code, upload it into your Github page & provide link to your Github page.
